INTEGRATION GUIDE

PROPOSAL · V0.1 · NOVEMBER 2026

SKYYTASK × SHOOTPORTAL

Deliverables Integration Guide

How SkyyTask pilots will deliver photos, video and inspection data to clients through ShootPortal: the full workflow, what each person sees, and what each team builds.

SKYY TASK × ShootPortal

Prepared for
SkyyTask leadership & development team

01	**The idea**	Today vs. tomorrow, who's involved
02	**How it works, end to end**	Seven steps from job to download
03	**What each person sees**	Pilot, client, SkyyTask
04	**Who does what**	What each team builds, data exchanged, choices
05	**Included, security & next steps**	Features, test vs. live, timeline, go-live

One button for pilots
"Transfer deliverables" opens a branded upload screen, already linked to the job.

One link for clients
A private, branded portal. No codes, no accounts, no Google Drive.

Status for SkyyTask
Submitted, published, viewed and downloaded, as they happen.

Jackson Bridges · Founder, ShootPortal
jackson@shootportal.app (662) 687-1259 shootportal.app

Proposed integration, in development and not yet available. Screens are illustrated mockups with fake demo data.

01 · THE IDEA

Replace the code-and-Drive handoff with a branded delivery

Today a finished job ends with a one-time code and a Google Drive link. With ShootPortal, the pilot uploads inside the SkyyTask app, the client opens a private SkyyTask-branded portal, and SkyyTask is told about every step automatically.

TODAY

Complete Job › OTP code › Google Drive link

- ✕ Clients juggle a code and leave the app for Drive
- ✕ Unbranded folders; no view or download tracking
- ✕ Pilots manage folders and sharing by hand

WITH SHOOTPORTAL

Transfer deliverables › Upload › Branded client portal

- ✓ One tap in the SkyyTask app opens the upload screen, already linked to the job
- ✓ Clients get a private link: no codes, no accounts, no passwords
- ✓ SkyyTask sees submitted, viewed and downloaded as they happen
- ✓ Everything carries SkyyTask's logo, colors and (optionally) domain

A Who's involved

SkyyTask servers
Create jobs in ShootPortal and receive status updates. Hold the secret key.

SkyyTask app
Shows the “Transfer deliverables” button and opens the upload screen.

The pilot
Uploads files from phone or computer. No ShootPortal account needed.

The client
Views and downloads through a private, branded link.

ShootPortal
Stores, organizes and delivers the media, and reports back.

B Principles we're designing around

SkyyTask stays in control
Jobs, chat, payments and the client relationship stay in SkyyTask. ShootPortal is the delivery layer only. No quotes, invoices or payment screens appear anywhere.

Branded end to end
Upload screen, portal and emails use SkyyTask's name, logo and colors, with a small “Powered by ShootPortal” mark.

Built for big files and bad signal
Uploads go in small chunks straight to secure storage. If the connection drops or the app closes, it resumes instead of starting over.

Private by default
Every link is private and expires. Secret keys never touch a phone. Every status message is signed so SkyyTask can trust it.

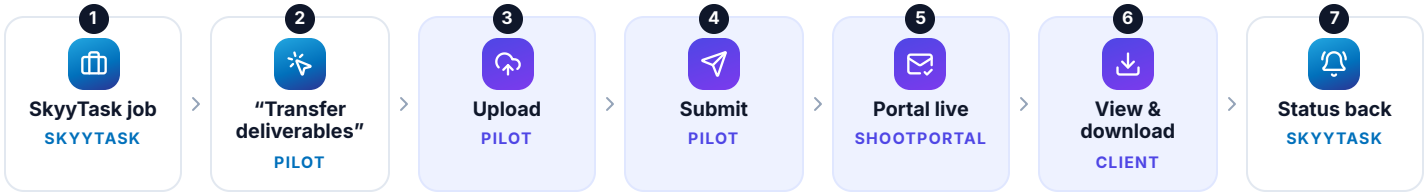

Works for marketplace and white-glove jobs alike. The same delivery can be created automatically by SkyyTask's app, or by SkyyTask staff signing in to ShootPortal directly for hand-managed enterprise jobs.

IN ONE SENTENCE

SkyyTask keeps the job, the chat and the client relationship. ShootPortal quietly handles the files: upload, storage, a beautiful branded handoff, and a signed receipt for every step.

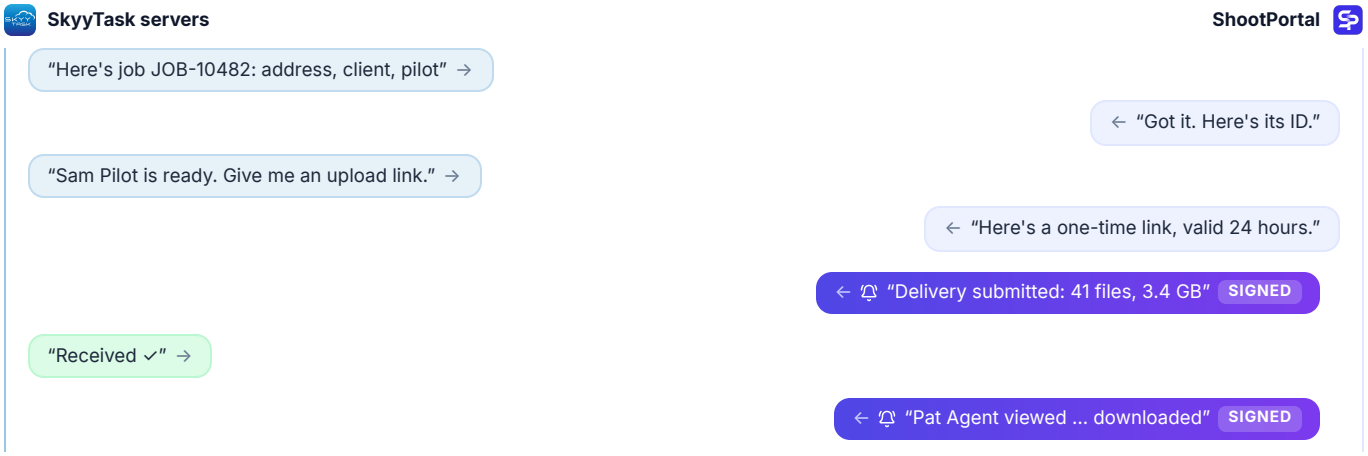

02 · HOW IT WORKS

From finished job to downloaded files, in seven steps

#	WHAT HAPPENS	WHAT PEOPLE SEE	WHAT SKYYTASK RECEIVES
1	**The job is set up.** SkyyTask's servers send ShootPortal the job number, address, client and pilot. Once per job.	Nothing yet. SkyyTask staff signed in to ShootPortal would see the job listed.	A ShootPortal ID for the job. SkyyTask can also always look it up by its own job number.
2	**The pilot taps “Transfer deliverables.”** SkyyTask asks for a one-time upload link (valid up to 24 hours) and opens it inside the app.	The pilot sees a SkyyTask-branded upload screen for this job: 123 Demo Street.	The upload link.
3	**The pilot uploads.** Photos, video, documents and inspection files go straight to secure storage in small chunks.	Progress for every file. If signal drops or the app is closed, it resumes where it left off.	Nothing yet (no noise per file).
4	**The pilot submits.** “Are you finished with this job?” → Yes. ShootPortal measures the delivery's total size.	A “Delivered!” confirmation, then the screen returns to the SkyyTask app.	`delivery.submitted` with file count, total size and the delivery's price.
5	**The portal goes live.** Automatically by default, or after SkyyTask reviews and approves.	The client gets a branded “Your deliverables are ready” email, or SkyyTask sends the link in its own chat. SkyyTask chooses.	`delivery.published`, plus a private portal link SkyyTask can share.
6	**The client views and downloads.** No login, no code. The link is private and expires with the files.	A clean SkyyTask-branded gallery with download buttons and “Available until …”.	`delivery.viewed` and `delivery.downloaded`, the first time each client does each.
7	**After 90 days** the files expire, unless storage is extended for that job.	The portal shows the delivery has expired.	The expiry date is known from step 4 onward.

A Behind the scenes: what the two systems say to each other

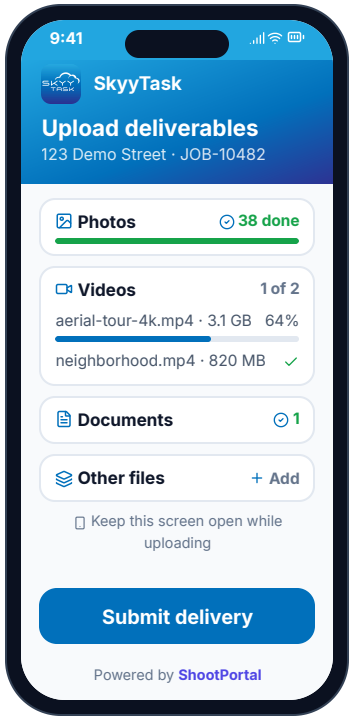

Why it matters: SkyyTask can mark jobs complete, show “client viewed ✓” or release a pilot payout the moment the right update arrives. If SkyyTask's servers are briefly unavailable, ShootPortal keeps retrying each update for up to three days, so nothing is lost.

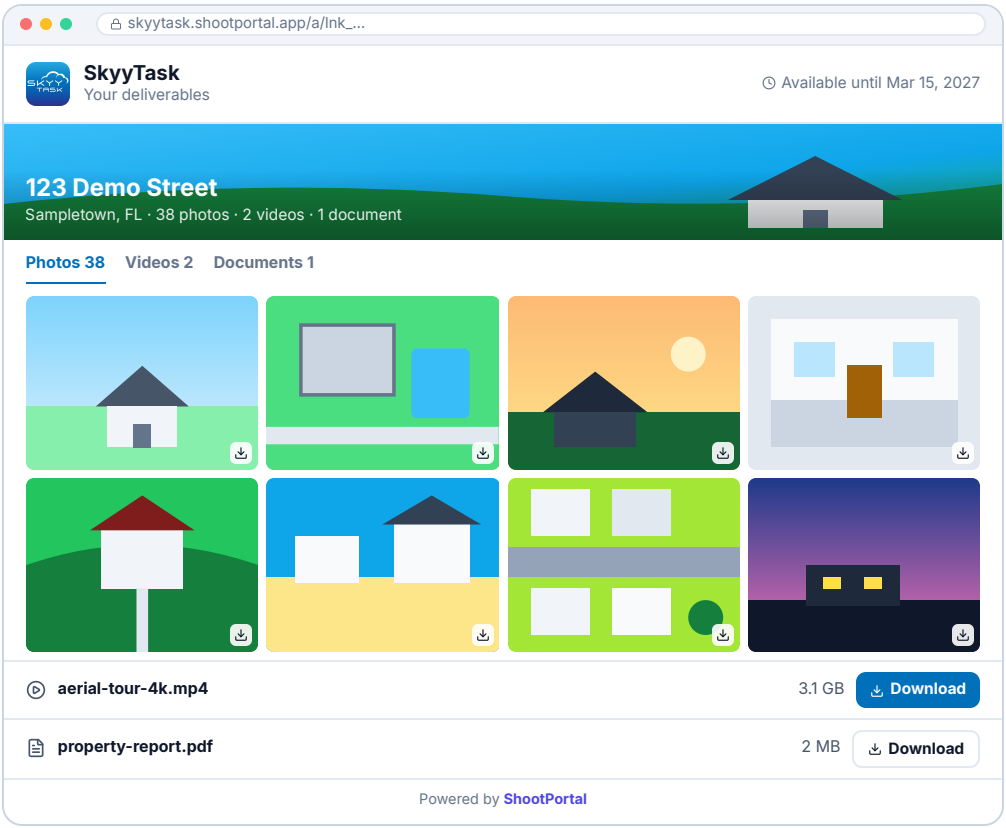

03 · WHAT EACH PERSON SEES

Three screens, one brand

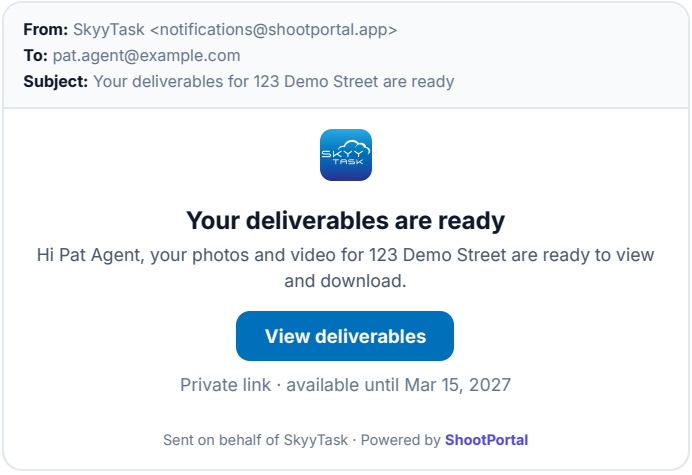

Illustrated mockups with fake demo data. Final screens will be shown with real screenshots once the integration is built.

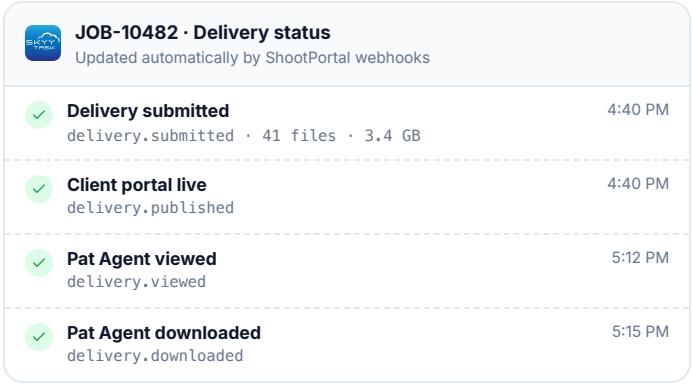

The pilot
Opens from "Transfer deliverables". Uploads resume automatically; a "Keep this screen open" reminder shows while files transfer.

The client: private portal
No login. Only this job's media, organized by type, with download buttons and the expiry date. No pricing or payment screens, ever.

The client: notification
Sent by ShootPortal in SkyyTask's name, or skipped entirely if SkyyTask prefers to share the link in its own chat.

SkyyTask: live status
An example of what SkyyTask could show inside its own app, driven by ShootPortal's signed status updates.

04 · WHO DOES WHAT

A small build for SkyyTask, the heavy lifting on ShootPortal

SkyyTask's team builds

1. **Create the job in ShootPortal**
   One server call when a job is accepted or completed (your choice).
2. **The “Transfer deliverables” button**
   Ask ShootPortal for an upload link and open it in the app's in-app browser.
3. **A status receiver**
   A small endpoint that checks each update's signature and moves the job forward.
4. **Optional: share the link in chat**
   If SkyyTask prefers to message the client itself.

ShootPortal provides

- The API, a full test sandbox and test keys
- The branded, resumable upload screen (phone and desktop)
- Secure storage for every file type, 90 days included
- The private, branded client portal and emails
- Signed, automatically retried status updates
- Developer Guide, API reference and a Postman collection
- A live demo partner to try the full flow before writing code
- Direct founder support during integration

A Information exchanged

SKYYTASK SENDS →	← SHOOTPORTAL SENDS BACK
Job: your job number, title, address	**Links**: the upload link and private portal links
Clients: name, email (phone optional), your client ID	**Status**: submitted, published, viewed, downloaded, expired
Pilot: name, email, your pilot ID	**Details**: file counts, total size, expiry date
Nothing else. No prices, payments or private job details.	**Price** of each delivery, the moment it's submitted

B Choices SkyyTask makes

- **Who notifies the client**
  ShootPortal email, SkyyTask's own chat, or both.
- **Publish automatically or review first**
  Go live on submit, or approve each delivery.
- **Web address**
  skyytask.shootportal.app to start, or your own, e.g. deliver.skyytask.com.
- **Pilot receipt email**
  Optional “Delivery received” confirmation.

C To decide together

- Create the ShootPortal job when it's **accepted**, or at **Complete Job**?
- Which status should trigger pilot payouts: submitted, viewed or downloaded?
- Is a one-time code still needed, or is a private link enough?
- App technology, and in-app browser vs. web view for the upload screen
- Typical monthly job volume and delivery sizes by job type
- Enterprise file types to support first (thermal, GeoTIFF, LAS/LAZ, KMZ, reports)

D Works with any app technology

iOS
Open the upload link in an in-app Safari view (SFSafariViewController).

Android
Open it in Chrome Custom Tabs.

React Native / Flutter
Use the framework's in-app browser plugin.

Web & desktop
Open it in a new tab or window; it returns when done.

05 · INCLUDED, SECURITY & NEXT STEPS

Everything in one delivery layer

Branding & domain
Logo, colors, sender name, your own web address.

Resumable uploads
Multi-GB files from a phone, resumed after drops.

Every file type
Photo, video, PDF, thermal, GeoTIFF, LAS/LAZ, KMZ, RAW.

90-day storage
Included per delivery; extend for archives.

Unlimited recipients
Every stakeholder gets their own private link.

View & download tracking
Know when each client opened and downloaded.

No commercial screens
No quotes, invoices or payments anywhere.

Founder support
Direct line during integration and launch.

A Security & privacy

- **Secret keys stay on SkyyTask's servers.** Phones only ever get a one-job, short-lived upload link.
- **Signed status updates.** Each message carries a tamper-proof signature SkyyTask verifies.
- **Private, expiring links** for every client; files are never public.
- **Isolated data.** SkyyTask's jobs live in their own walled-off space.
- **Minimal data.** Names and emails only. No prices, payments or job financials.

B Test mode vs. live mode

TEST

A full copy for building and demos. Nothing is billed; emails go only to addresses you approve.

LIVE

Real pilots and clients. Same code: just swap in a live key.

C Timeline

Nov 11, 2026
Walkthrough & open questions

Mid-December
Sandbox & test keys for your developers

January 2027
Uploads, client portal & webhooks

February 2027
Go-live review & live keys

D Go-live checklist

- Jobs created with your job number
- Upload screen opens in-app
- Large upload resumed on a real phone
- Status signatures verified
- All status events handled
- Live key issued & test data cleared

NEXT STEPS

01 Review together
Walk through this guide on our Nov 11 call.

02 Decide the open points
The “to decide together” list on page 5.

03 Meet your developers
A technical walkthrough with the Developer Guide.

04 Start in the sandbox
Test keys and a demo partner to build against.

Pricing is provided separately in the SkyyTask × ShootPortal Pricing Sheet.
